

1. HTML and CSS are usually used combined. The former is used to describe the contents of a internet page. The latter is used to describe its appearance.

2. A class is an attribute that classifies different elements. Hence, it is possible to apply style features to entire classes. An ID has the same function, but operates more specifically. Instead of being applicable onto a class it directs no more than one element per page.

div .box

```
{  
  
}
```

3.

<title> is the title of the page. This is displayed in the tab.

<h1> is the main heading of the page. It is possible to use a second heading as well.

<link> This is used, in combination with attributes to link the html file tot he css file.

<p> is used to show the main tekst of the page.

<head> HTML makes a difference between the head and the body of a page. The head contains information that is not shown on the page itself, like the title and the link to the css file.

4. The padding surrounds the content directly. It is the space between the content and the border. The space between the border and other elements is the margin.

5.
